- Example and properties
- Rounding, addition, multiplication
- Floating point in C
- Summary

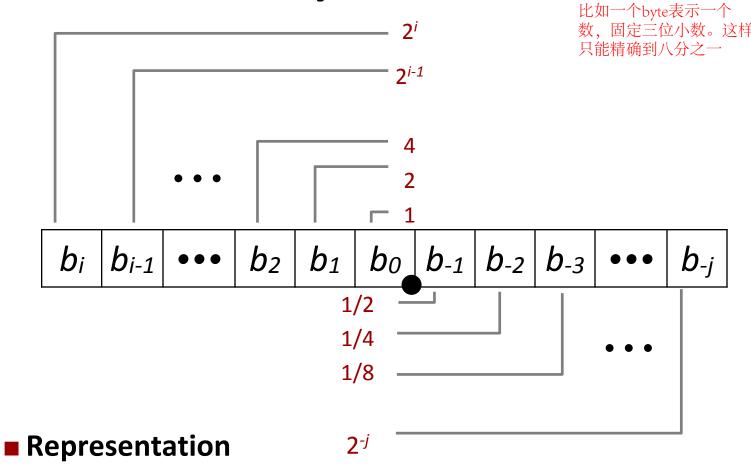

Fractional binary numbers

What is 1011.101₂?

小数点在哪?

简单方法: 固定小数位数

Fractional Binary Numbers

- Bits to right of "binary point" represent fractional powers of 2
- Represents rational number: $\sum_{k=-i}^{i} b_k imes 2$

Fractional Binary Numbers: Examples

Value

Representation

每个数代表它附近的一个范围

5 3/4

2 7/8

17/16

101.112

10.1112

1.01112

Observations

- Divide by 2 by shifting right (unsigned)
- Multiply by 2 by shifting left
- Numbers of form 0.1111111...2 are just below 1.0

■
$$1/2 + 1/4 + 1/8 + ... + 1/2^i + ... \rightarrow 1.0$$

■ Use notation 1.0 – ε

Representable Numbers

Limitation #1

- Can only exactly represent numbers of the form x/2^k
 - Other rational numbers have repeating bit representations

```
Value Representation
```

- 1/3 0.01010101[01]...₂
- **1/5** 0.00110011[0011]...2
- 1/10 0.000110011[0011]...₂

Limitation #2

- Just one setting of binary point within the w bits
 - Limited range of numbers (very small values? very large?)

Today: Floating Point

- Background: Fractional binary numbers
- IEEE floating point standard: Definition
- Example and properties
- Rounding, addition, multiplication
- Floating point in C
- Summary

IEEE Floating Point

IEEE Standard 754

- Established in 1985 as uniform standard for floating point arithmetic
 - Before that, many idiosyncratic formats
- Supported by all major CPUs

Driven by numerical concerns

- Nice standards for rounding, overflow, underflow
- Hard to make fast in hardware
 - Numerical analysts predominated over hardware designers in defining standard

Floating Point Representation

Numerical Form:

$$(-1)^{s} M 2^{E}$$

- Sign bit s determines whether number is negative or positive
- **Significand M** normally a fractional value in range [1.0,2.0).
- Exponent E weights value by power of two

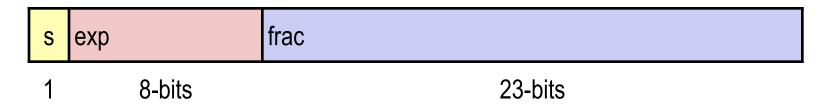

Encoding

- MSB s is sign bit s
- exp field encodes *E* (but is not equal to E)
- frac field encodes M (but is not equal to M)

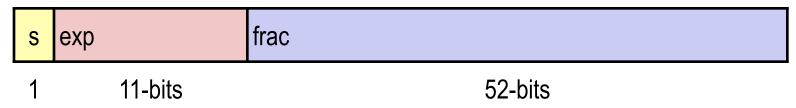

S	ехр	frac
---	-----	------

Precision options

Single precision: 32 bits

Double precision: 64 bits

Extended precision: 80 bits (Intel only)

S	ехр	frac
1	15-bits	63 or 64-bits

"Normalized" Values

$$V = (-1)^s M 2^E$$

- When: exp ≠ 000...0 and exp ≠ 111...1
- Exponent coded as a *biased* value: *E* = *Exp* − *Bias*
 - Exp: unsigned value of exp field
 - $Bias = 2^{k-1} 1$, where k is number of exponent bits
 - Single precision: 127 (Exp: 1...254, E: -126...127)
 - Double precision: 1023 (Exp: 1...2046, E: -1022...1023)
- Significand coded with implied leading 1: M = 1.xxx...x2
 - xxx...x: bits of frac field
 - Minimum when frac=000...0 (M = 1.0)
 - Maximum when frac=111...1 (M = 2.0ε)
 - Get extra leading bit for "free"

Normalized Encoding Example

$$V = (-1)^s M 2^E$$

 $E = Exp - Bias$

- Value: float F = 15213.0;
 - $15213_{10} = 11101101101101_2$ = 1.1101101101101_2 x 2^{13}

Significand

$$M = 1.101101101_2$$

frac= 1101101101101000000000_2

Exponent

$$E = 13$$
 $Bias = 127$
 $Exp = 140 = 10001100_{2}$

Result:

 0
 10001100
 11011011011010000000000

 s
 exp
 frac

Denormalized Values

$$V = (-1)^{s} M 2^{E}$$

 $E = 1 - Bias$

- **■** Condition: exp = 000...0
- Exponent value: E = 1 Bias (instead of E = 0 Bias)
- Significand coded with implied leading 0: *M* = 0.xxx...x₂
 - xxx...x: bits of frac
- Cases
 - exp = 000...0, frac = 000...0
 - Represents zero value
 - Note distinct values: +0 and -0 (why?)
 - exp = 000...0, frac ≠ 000...0
 - Numbers closest to 0.0
 - Equispaced

Special Values

- **■** Condition: exp = 111...1
- Case: exp = 111...1, frac = 000...0
 - Represents value ∞ (infinity)
 - Operation that overflows
 - Both positive and negative
 - E.g., $1.0/0.0 = -1.0/-0.0 = +\infty$, $1.0/-0.0 = -\infty$
- Case: exp = 111...1, frac ≠ 000...0
 - Not-a-Number (NaN)
 - Represents case when no numeric value can be determined
 - E.g., sqrt(-1), $\infty \infty$, $\infty \times 0$

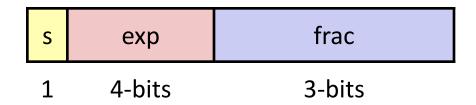

Visualization: Floating Point Encodings

Today: Floating Point

- Background: Fractional binary numbers
- IEEE floating point standard: Definition
- Example and properties
- Rounding, addition, multiplication
- Floating point in C
- **■** Summary

Tiny Floating Point Example

8-bit Floating Point Representation

- the sign bit is in the most significant bit
- the next four bits are the exponent, with a bias of 7
- the last three bits are the frac

Same general form as IEEE Format

- normalized, denormalized
- representation of 0, NaN, infinity

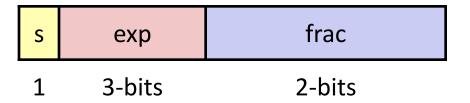

Dynamic Range (Positive Only) $V = (-1)^s M 2^E$

	s	exp	frac	E	Value	n: E = Exp - Bias
	0	0000	000	-6	0	d: E = 1 - Bias
	0	0000	001	-6	1/8*1/64 = 1/512	closest to zero
Denormalized	0	0000	010	-6	2/8*1/64 = 2/512	Clodest to Zero
numbers						
	0	0000	110	-6	6/8*1/64 = 6/512	
	0	0000	111	-6	7/8*1/64 = 7/512	largest denorm
	0	0001	000	-6	8/8*1/64 = 8/512	
	0	0001	001	-6	9/8*1/64 = 9/512	smallest norm
	0	0110	110	-1	14/8*1/2 = 14/16	
	0	0110	111	-1	15/8*1/2 = 15/16	closest to 1 below
Normalized	0	0111	000	0	8/8*1 = 1	
numbers	0	0111	001	0	9/8*1 = 9/8	closest to 1 above
	0	0111	010	0	10/8*1 = 10/8	closest to 1 above
	0	1110	110	7	14/8*128 = 224	
	0	1110	111	7	15/8*128 = 240	largest norm
	0	1111	000	n/a	inf	

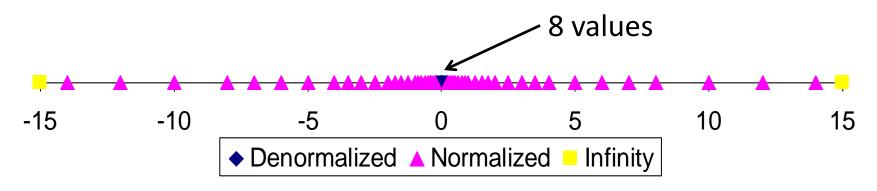

Distribution of Values

6-bit IEEE-like format

- e = 3 exponent bits
- f = 2 fraction bits
- Bias is $2^{3-1}-1=3$

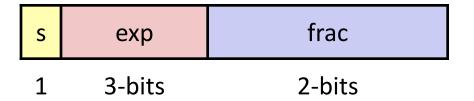

Notice how the distribution gets denser toward zero.

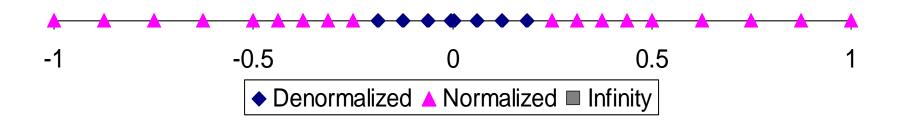

Distribution of Values (close-up view)

6-bit IEEE-like format

- e = 3 exponent bits
- f = 2 fraction bits
- Bias is 3

Special Properties of the IEEE Encoding

- **■** FP Zero Same as Integer Zero
 - All bits = 0
- Can (Almost) Use Unsigned Integer Comparison
 - Must first compare sign bits
 - Must consider -0 = 0
 - NaNs problematic
 - Will be greater than any other values
 - What should comparison yield?
 - Otherwise OK
 - Denorm vs. normalized
 - Normalized vs. infinity

Today: Floating Point

- Background: Fractional binary numbers
- IEEE floating point standard: Definition
- Example and properties
- Rounding, addition, multiplication
- Floating point in C
- Summary

Floating Point Operations: Basic Idea

- $\mathbf{x} +_{\mathbf{f}} \mathbf{y} = \text{Round}(\mathbf{x} + \mathbf{y})$
- $\mathbf{x} \times_{\mathbf{f}} \mathbf{y} = \text{Round}(\mathbf{x} \times \mathbf{y})$

Basic idea

- First compute exact result
- Make it fit into desired precision
 - Possibly overflow if exponent too large
 - Possibly round to fit into frac

Rounding

Rounding Modes (illustrate with \$ rounding)

	\$1.40	\$1.60	\$1.50	\$2.50	-\$1.50
Towards zero	\$1	\$1	\$1	\$2	- \$1
■ Round down $(-\infty)$	\$1	\$1	\$1	\$2	- \$2
• Round up $(+\infty)$	\$2	\$2	\$2	\$3	- \$1
Nearest Even (default)	\$1	\$2	\$2	\$2	- \$2

Closer Look at Round-To-Even

Default Rounding Mode

- Hard to get any other kind without dropping into assembly
- All others are statistically biased
 - Sum of set of positive numbers will consistently be over- or underestimated

Applying to Other Decimal Places / Bit Positions

- When exactly halfway between two possible values
 - Round so that least significant digit is even
- E.g., round to nearest hundredth

7.8949999	7.89	(Less than half way)
7.8950001	7.90	(Greater than half way)
7.8950000	7.90	(Half way—round up)
7.8850000	7.88	(Half way—round down)

Rounding Binary Numbers

Binary Fractional Numbers

- "Even" when least significant bit is 0
- "Half way" when bits to right of rounding position = 100...2

Examples

Round to nearest 1/4 (2 bits right of binary point)

Value Value	Binary	Rounded	Action	Rounded
2 3/32	10.000112	10.002	(<1/2—down)	2
2 3/16	10.00 <mark>110</mark> 2	10.012	(>1/2—up)	2 1/4
2 7/8	10.11 <mark>100</mark> 2	11.002	(1/2—up)	3
2 5/8	10.10 <mark>100</mark> 2	10.102	(1/2—down)	2 1/2

FP Multiplication

- $-(-1)^{s1} M1 2^{E1} \times (-1)^{s2} M2 2^{E2}$
- Exact Result: (-1)^s M 2^E
 - Sign s: s1 ^ s2
 - Significand *M*: *M1* x *M2*
 - Exponent E: E1 + E2

Fixing

- If $M \ge 2$, shift M right, increment E
- If E out of range, overflow
- Round M to fit frac precision

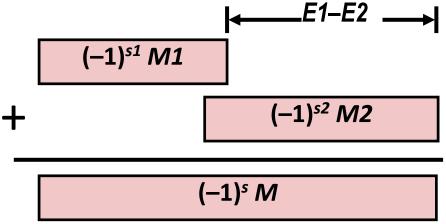

Implementation

Biggest chore is multiplying significands

Floating Point Addition

- - **A**ssume *E1* > *E2*
- Exact Result: (-1)^s M 2^E
 - ■Sign *s*, significand *M*:
 - Result of signed align & add
 - Exponent E: E1

Get binary points lined up

Fixing

- ■If $M \ge 2$, shift M right, increment E
- •if M < 1, shift M left k positions, decrement E by k
- Overflow if E out of range
- Round *M* to fit **frac** precision

Mathematical Properties of FP Add

Compare to those of Abelian Group

Closed under addition?

- Yes
- But may generate infinity or NaN
- Commutative?

Yes

Associative?

No

- Overflow and inexactness of rounding
- (3.14+1e10)-1e10 = 0, 3.14+(1e10-1e10) = 3.14
- 0 is additive identity?

Yes

Every element has additive inverse?

Almost

Yes, except for infinities & NaNs

Monotonicity

Almost

- $a \ge b \Rightarrow a+c \ge b+c$?
 - Except for infinities & NaNs

Mathematical Properties of FP Mult

Compare to Commutative Ring

Closed under multiplication?

Yes

But may generate infinity or NaN

Multiplication Commutative?

Yes

Multiplication is Associative?

No

Possibility of overflow, inexactness of rounding

■ Ex: (1e20*1e20) *1e-20= inf, 1e20* (1e20*1e-20) = 1e20

1 is multiplicative identity?

Yes

Multiplication distributes over addition?

No

Possibility of overflow, inexactness of rounding

• 1e20*(1e20-1e20)=0.0, 1e20*1e20 - 1e20*1e20 = NaN

Monotonicity

 $a \ge b \ \& c \ge 0 \Rightarrow a * c \ge b * c$?

Almost

Except for infinities & NaNs

Today: Floating Point

- Background: Fractional binary numbers
- IEEE floating point standard: Definition
- Example and properties
- Rounding, addition, multiplication
- Floating point in C
- Summary

Floating Point in C

C Guarantees Two Levels

- •float single precision
- **double** double precision

Conversions/Casting

- Casting between int, float, and double changes bit representation
- double/float → int
 - Truncates fractional part
 - Like rounding toward zero
 - Not defined when out of range or NaN: Generally sets to TMin
- int → double
 - Exact conversion, as long as int has ≤ 53 bit word size
- int → float
 - Will round according to rounding mode

Floating Point Puzzles

For each of the following C expressions, either:

- Argue that it is true for all argument values
- Explain why not true

```
int x = ...;
float f = ...;
double d = ...;
```

Assume neither **d** nor **f** is NaN

```
• x == (int)(float) x
• x == (int) (double) x
f == (float) (double) f
• d == (double) (float) d
• f == -(-f);
• 2/3 == 2/3.0
• d < 0.0 \Rightarrow ((d*2) < 0.0)
• d > f \Rightarrow -f > -d
• d * d >= 0.0
• (d+f)-d == f
```

Summary

- IEEE Floating Point has clear mathematical properties
- Represents numbers of form M x 2^E
- One can reason about operations independent of implementation
 - As if computed with perfect precision and then rounded
- Not the same as real arithmetic
 - Violates associativity/distributivity
 - Makes life difficult for compilers & serious numerical applications programmers

Additional Slides

Creating Floating Point Number

Steps

- Normalize to have leading 1
- Round to fit within fraction

s exp frac

1 4-bits 3-bits

Postnormalize to deal with effects of rounding

Case Study

Convert 8-bit unsigned numbers to tiny floating point format

Example Numbers

128	1000000
15	00001101
33	00010001
35	00010011
138	10001010
63	00111111

Normalize

	S	ехр	frac
_	1	4-bits	3-bits

Requirement

- Set binary point so that numbers of form 1.xxxxx
- Adjust all to have leading one
 - Decrement exponent as shift left

Value	Binary	Fraction	Exponent
128	1000000	1.000000	7
15	00001101	1.1010000	3
17	00010001	1.0001000	4
19	00010011	1.0011000	4
138	10001010	1.0001010	7
63	0011111	1.1111100	5

Rounding

1.BBGRXXX

Guard bit: LSB of result

Round bit: 1st bit removed

Sticky bit: OR of remaining bits

Round up conditions

- Round = 1, Sticky = $1 \rightarrow > 0.5$
- Guard = 1, Round = 1, Sticky = 0 → Round to even

Value	Fraction	GRS	Incr?	Rounded
128	1.0000000	000	N	1.000
15	1.1010000	100	N	1.101
17	1.0001000	010	N	1.000
19	1.0011000	110	Y	1.010
138	1.0001010	011	Y	1.001
63	1.1111100	111	Y	10.000

Postnormalize

Issue

- Rounding may have caused overflow
- Handle by shifting right once & incrementing exponent

Value	Rounded	Exp	Adjusted	Result
128	1.000	7		128
15	1.101	3		15
17	1.000	4		16
19	1.010	4		20
138	1.001	7		134
63	10.000	5	1.000/6	64

Interesting Numbers

Double $\approx 1.8 \times 10^{308}$

{single,double}

Description	exp	frac	Numeric Value
Zero	0000	0000	0.0
Smallest Pos. Denorm.	0000	0001	$2^{-\{23,52\}} \times 2^{-\{126,1022\}}$
■ Single $\approx 1.4 \times 10^{-45}$			
■ Double $\approx 4.9 \times 10^{-324}$			
Largest Denormalized	0000	1111	$(1.0 - \varepsilon) \times 2^{-\{126,1022\}}$
■ Single $\approx 1.18 \times 10^{-38}$			
■ Double $\approx 2.2 \times 10^{-308}$			
Smallest Pos. Normalized	0001	0000	1.0 x $2^{-\{126,1022\}}$
Just larger than largest denor	malized		
One	0111	0000	1.0
Largest Normalized	1110	1111	$(2.0 - \varepsilon) \times 2^{\{127,1023\}}$
■ Single $\approx 3.4 \times 10^{38}$
